Router Shape Cutting Tip Sheet

- Router cut paths must be vector shapes.
- If you are working with images in Illustrator please provide linked images not embedded.
- If using a clipping mask do not include the cut path in the clipping mask.
- Create cut path on a separate layer.

Create Your Cut Path With The Router Bit In Mind.

The router can cut outside sharp angles.

Inside sharp angles are a problem the router bit is round and you are left with a corner radius the size of the bit.

Generally a 1/4" Bit is used.

For best results create a path that fits the bit and Leave 1/8" to 1/4" image bleed around cut path if possible.
